Introduction

1.1 Background

Soon after the earthquake and tsunami in Japan that occurred on March 11, 2011, and subsequent release of radioactive materials from the Fukushima Daiichi Nuclear Power Station, the Department of Defense (DOD) responded by providing humanitarian assistance and disaster relief in Operation Tomodachi. The DOD established the Operation Tomodachi Registry (OTR) as part of DOD's environmental health surveillance registries and the [Operation Tomodachi Registry website](#). The OTR is overseen by an OTR Steering Group and four working groups. The Dose Assessment and Recording Working Group (DARWG) was tasked with developing radiation dose assessments for a DOD-affiliated population of approximately 70,000 individuals.

To estimate radiation doses, the DARWG identified, evaluated, and selected available environmental and personal radiation monitoring data. The DARWG reviewed the results of environmental radiation measurements reported by DOD, Department of Energy (DOE), and Government of Japan (GOJ) teams (Cassata et al., 2012; AIPH, 2011; MEXT, 2013; NNSA, 2012). Those measurement results are available online for DOD and DOE at <http://www.data.gov> or at <http://www.mext.go.jp/english/incident/index.htm> for GOJ. Results included external exposure rates and activity concentrations in air, water, and soil from measurements taken at or near locations where DOD-affiliated individuals worked or lived. Using these results, the DARWG prepared datasets for input to calculation worksheets developed to estimate both external and internal radiation dose. These datasets comprised measured, derived, interpolated or extrapolated quantities for each hour of the period from March 12 to May 11, 2011 as described in Cassata et al. (2012) and summarized in Table 25 of the same report. The dose results for individuals located at 13 DARWG locations on two of the main islands of Japan were reported in Cassata et al. (2012) and were included in the OTR (ASD(HA), 2011). Overall, the input datasets were used in dose calculations discussed in the following reports:

- *Radiation Dose Assessments for Shore-Based Individuals in Operation Tomodachi, Revision 1*, DTRA-TR-12-001 (R1) (Cassata et al., 2012).
- *Probabilistic Analysis of Radiation Doses for Shore-Based Individuals in Operation Tomodachi*, DTRA-TR-12-002 (Chehata et al., 2013).
- *Radiation Internal Monitoring by In Vivo Scanning in Operation Tomodachi*, DTRA-TR-12-004 (Cassata et al., 2013).
- *Radiation Dose Assessments for the Embryo, Fetus, and Nursing Infant during Operation Tomodachi*, DTRA-TR-12-017 (Falo et al., 2013).
- *Radiation Doses for Fleet-Based Individuals in Operation Tomodachi*, DTRA-TR-12-041 (Marro et al., 2013).

1.2 Purpose

The purpose of this Data Compendium is to provide the datasets that the DARWG used in its dose calculations so they are available for review, examination and use by interested parties. The datasets include radiation dose or exposure rates; activity concentrations in air, water, and soil; and dose coefficients, which were used to calculate the radiation doses published in the reports listed above. The Data Compendium contains the following types of values:

- Direct and derived values from measurements.
- Surrogate data, i.e., measurement results from one location assigned to another location.
- Values estimated through the use of data models that are based on measured values from either of the above sources.
- Dose coefficients published by the International Commission on Radiological Protection (ICRP).

Figure 1 contains a conceptual diagram of the process for preparing the input datasets included in this Data Compendium and for calculating the doses reported in the OTR.

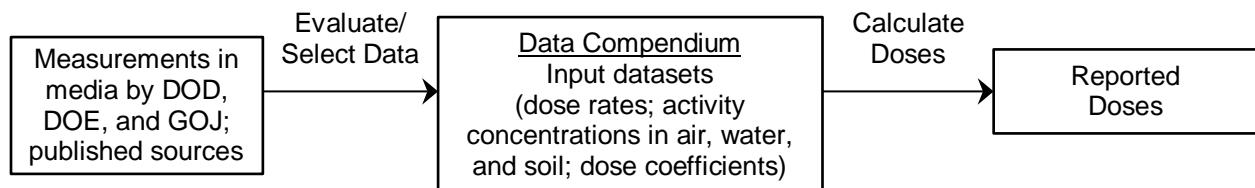

Figure 1. Process for preparing and using input datasets for doses reported in the OTR

1.3 Radiation Dose Input Datasets

The measurement results originally reported by various organizations were used to produce the dose rate and activity concentration input datasets listed in this Data Compendium. External dose or exposure rate measurements reported by various DOD and DOE organizations (NNSA, 2012) were combined with measurement data reported by the GOJ (MEXT, 2013) to produce values for each hour in the two-month assessment period. Activity concentration values in air were derived from measurements on samples collected by DOD, DOE, or the Comprehensive Test Ban Treaty Organization (Cassata et al, 2012). The results were used directly, as surrogate data for locations where measurements were not taken, or as the basis for models that used interpolation, extrapolation, decay, and other methods to estimate concentrations on days without measurements (Cassata et al, 2012). Activity concentration values in water were derived from measurements made by the GOJ (MEXT, 2013) or DOD for municipal water systems that served the OTR population within DARWG locations. The water activity concentrations were generally used without adjustment (Cassata et al, 2012). Activity concentration values in soil reported by DOD were used as the basis for modeling to estimate values for days when measurements were not made or when there were multiple measurements

on a single day (Cassata et al, 2012). Radiation dose coefficients as radiation dose per unit intake listed in this Data Compendium were obtained directly from an ICRP source (ICRP, 2001).

Note: All time periods and isotopes where data were not available or where the results of the measurements were below the detection limits of the instruments used are labeled with an *em dash* (—). All dates and times are in Japan Standard Time.

Section 2.

Activity Concentrations in Air

Table 1 through Table 5 include input datasets of activity concentration values in airborne aerosols for the International Monitoring Station at Takasaki (IMS-Takasaki), Misawa Air Base, Sendai, Ishinomaki, and Yokota Air Base. The Yokota Air Base input datasets were also used in the calculation of doses for Akasaka Press Center (Tokyo), Atsugi Naval Air Facility, and Yokosuka Naval Base (Cassata et al., 2012). These tables contain the values used for dose calculations from inhalation of radioactive materials in the air. In addition to the values shown in Table 1 through Table 5, activity concentrations in air for Sr-89, Sr-90, and gaseous iodines were calculated as described in Cassata et al., (2012), and were included in the inhalation dose calculations. Inhalation doses are included in the results reported on the OTR (ASD(HA), 2011) website.

Section 3.

Activity Concentrations in Drinking Water

Table 6 through Table 12 include input datasets of activity concentrations in water for IMS-Takasaki, Hyakuri Air Base, Oyama, Yokota Air Base, Akasaka Press Center (Tokyo), Atsugi Naval Air Facility, and Yokosuka Naval Base, respectively. All drinking water results reported for Misawa Air Base, Yamagata, Camp Fuji, Iwakuni Marine Corps Air Station, and Sasebo Naval Base were below detection limits. These tables contain values used for dose calculations for ingestion of radioactive materials in the drinking water. Doses from water ingestion are included in the results reported on the OTR (ASD(HA), 2011) website.

Section 4.

Activity Concentrations in Soil

Table 13 through Table 17 contain input datasets of activity concentrations in soil used to calculate doses for Sendai, Yokota Air Base, Akasaka Press Center (Tokyo), Atsugi Naval Air Facility, and Yokosuka Naval Base, respectively. These tables contain the values used for calculation of doses from the incidental ingestion of radioactive materials in soil and dust. Doses from the incidental ingestion of soil and dust are included in the results reported on the OTR (ASD(HA), 2011) website.

Section 5.

External Dose Rates

Input datasets of external radiation dose rates for all 13 DARWG locations and the international monitoring station described in Cassata et al. (2012) are contained in Table 18. The dose rates are listed on an hourly basis, as they were reported. The values listed are net values above background dose rates. Background dose rates are those which existed prior to the accident and subsequent releases of radioactive materials.

Section 6.

Dose Coefficients

Dose coefficients for adults and for five age groups of children were found in the ICRP Database of Dose Coefficients: Workers and Members of the Public (ICRP, 2001). The database contains dose coefficients from ICRP Publication 68 “Dose Coefficients for Intakes of Radionuclides by Workers” (ICRP, 1994) and ICRP 72 “ICRP Publication 72: Age-dependent Doses to the Members of the Public from Intake of Radionuclides Part 5, Compilation of Ingestion and Inhalation Coefficients” (ICRP, 1995). The inhalation dose coefficients are committed effective dose and committed equivalent dose for the thyroid (50 years for adults and to age 70 for children), for absorption Type F, and for a particle size distribution of one micrometer activity median aerodynamic diameter. The inhalation dose coefficients are found in Table 19 (committed effective dose) and Table 20 (committed equivalent dose for the thyroid). The ICRP ingestion dose coefficients used for committed effective dose and committed equivalent dose for the thyroid are shown in Table 21 and Table 22, respectively. The dose coefficients used for the embryo/fetus and for nursing infants for doses resulting from intakes by the mother are reported in Falo et al. (2013).
